REINFORCED EARTH
Designer and supplier of civil engineering solutions that retain, cross and protect.

Reinforced Earth has been designing and supplying innovative geotechnical engineering structures and reinforced backfill solutions for more than half a century. Having invented the Reinforced Earth® system with more than 100,000 structures completed around the world, our group sets the standard.

OUR VISION
Reinforced Earth rolls out its leading technologies to serve clients’ projects, from the simplest to the most exceptional. Guided by our focus on innovation and our culture of excellence in client relations, we offer suitable, durable solutions. We build on our global expertise, which is applied by our local companies, to develop new applications and to address the challenges of the future.

Over 100,000 structures around the world

INNOVATING
Innovation, a key part of our process, enables us to meet our clients’ needs.

DESIGNING
Our engineers and technicians design structures that are both technically efficient and durable.

IMPLEMENTING
We align our resources and teams to ensure the success of each project.

ONCE UPON A TIME
In 1963, French engineer and architect Henri Vidal filed the patent for Reinforced Earth®. This brand new technique associates a selected and controlled backfill, together with reinforcements and facing panels, thus creating a sustainable composite material. The technique has many advantages. The structure requires a limited land take, can be adapted to all kinds of terrain, withstand heavy loads and resist to earthquakes. Reinforced Earth® is also a very cost-effective solution and can be implemented quickly.
Reinforced Earth offers its clients optimized state-of-the-art solutions. Our baseline services include structure design, supply of the specific components, and training of the teams in charge of construction. This ensures overall project consistency and success. Since inventing Reinforced Earth®, we have developed a broad range of technical solutions adapted to a wide variety of situations.

Our products

TECHSPAN®

The high-quality custom-designed arch

Our soil expertise and finite element analysis were used to develop this precast concrete arch technique, a two- or three-hinged triconical curve-shaped system.

REINFORCED EARTH®

The original Reinforced Earth® MSE wall

The product combines three elements - controlled backfill, strong reinforcements and modular facing panels - to form a durable retaining structure.

T-WALL®

The modular retaining wall

These precast concrete units are stacked to build gravity retaining walls.

TECHWALL®

The precast concrete retaining wall

This consolidated counterfort solution meets the requirements of walls built on footings.

ADDRESSING THE CHALLENGES OF THE FUTURE

The Innovation Department handles research and development. It innovates to meet the project-specific needs of the subsidiaries’ design offices and conducts an in-depth market and technology watch to anticipate future trends in the civil engineering sector.

The Group has developed some 100 major inventions, which are covered by 1,500 patents filed around the world.

INNOVATION & EXPERTISE

Designing solutions tailored to each project

Our design offices build on the Group’s accumulated experience. Our civil and geotechnical engineers design optimum solutions to ensure the structure’s reliability and durability. They are guided by the same visionary spirit that marked the inception of The Reinforced Earth Company.

NETWORKED EXPERTISE

Thanks to its international presence, Reinforced Earth is able to capitalize on its large network of engineers. The group’s Engineering Department coordinates the flow of knowledge and experience between the design offices of the various companies. It marshals the network’s expertise to provide technical support for the subsidiaries.

WORKING TOWARD WIDESPREAD USE OF BIM

Reinforced Earth is investing in BIM (Building Information Modeling). The digital model of the structure is used to integrate the full range of documentation. This enables all stakeholders to readily access justification, traceability and construction documents throughout the project.
MAJOR STAGES OF A PROJECT

Our teams are involved throughout the project, from the preliminary design, to engineering and construction.

1 DESIGN

The Reinforced Earth design office carries out the initial technical analysis and draws up a preliminary estimate based on the geotechnical conditions and the features of the engineering structure.

2 BID

The sales team coordinates with the design office to propose a detailed drawing of the structure, an associated construction timeline and a precise cost estimate.

3 FINAL DESIGN

Following signature of the contract, the design office produces the drawings, engineering calculations and execution methods.

4 MATERIAL SUPPLY

The Operations department takes over for the design office and manages the supply of materials directly.

5 CONSTRUCTION SERVICES

The components are delivered to the jobsite. The Operations team trains the contractor’s personnel in building the structures according to design office specifications. Our team remains available to provide technical expertise.
BUSINESS LINES

Our technical solutions are defined by three functions corresponding to the application of the structure to be designed:

**RETAIN, CROSS, PROTECT.**

---

**RETAIN**
Retaining structures
As the inventors of Reinforced Earth® and leaders in the soil reinforcement sector, we offer solutions for all retaining wall projects.

**CROSS**
Crossing structures
Our customised crossing solutions are used to build bridge abutments, bridges and tunnels under backfill.

**PROTECT**
Protective structures
Our solutions help protect people, infrastructure and the environment from natural and industrial hazards.
Building on its one-of-a-kind expertise in soil-structure interaction, the Reinforced Earth Group designs a wide variety of retaining structures. Our products can be used to build all types of structures corresponding to the RETAIN function, using many types of facing and reinforcement, including Reinforced Earth® retaining walls and reinforced embankments.

**Retaining structures**

**OUR PRODUCTS**

- Reinforced Earth®
  Since the product was invented, our engineers have continued to further develop it, notably by increasing the height of structures and designing new reinforcement systems to accommodate a wide variety of backfill materials.

- Shored Reinforced Earth®
  This complementary product combines excavation and backfill to build Reinforced Earth walls in front of existing walls or other retaining structures such as soil nail stabilized embankments.

- TechWall®
  This precast concrete retaining wall system consists of full-height panels. Each panel is cast with counterforts.

- T-Wall®
  This precast concrete retaining wall system is made up of T-shaped units with a rectangular facing and a toothed stem.

592 billion sq. feet of Reinforced Earth® walls worldwide
The B2 viaduct in the southern part of the country carries the E75 motorway, which links the cities of Demir Kapia and Smokvica, across the Vardar River and a railway line. Reinforced Earth designed the solution that facilitates access to the structure, which is made up of 80-foot high Reinforced Earth® retaining walls.
Crossing structures

To cross natural obstacles such as rivers and valleys, or man-made roads and railways, Reinforced Earth designs both overhead and underground crossing solutions.

Our products are used to build all types of structures to meet the CROSS function, such as reinforced backfill bridge abutments for overhead crossings, as well as cut-and-cover tunnels, culverts and underpasses for underground crossings.

OUR PRODUCTS

Reinforced Earth®
Our historic Reinforced Earth® product is used in a broad range of crossing solutions, including bridge abutments.

TechSpan®
Our precast concrete arch system is used to build arch structures under backfill. The precast concrete segments are delivered to the jobsite and assembled on the spot.
SOUTH KOREA
SKM road tunnel
To connect the city of Suwon with Gwangmyeong in the western suburbs of Seoul, Reinforced Earth built a 1.6-mile-long structure made up of two cut-and-cover tunnels using Techspan® arches, which were precast at the worksite.

UNITED KINGDOM
Heads of the Valleys
The A465 highway in southern Wales has been widened to a dual two-lane highway. Reinforced Earth designed and supplied the highest Techspan® arch ever built in the United Kingdom (with a height of over 30 feet), which is also the Techspan® arch with the highest to its location on a slope.
Protective structures

Reinforced Earth designs structures to protect people, infrastructure and the environment from natural and industrial hazards. Our range of solutions corresponding to the PROTECT function provide protection from natural hazards such as avalanches, earthquakes, tsunamis, flooding, rockfalls, coastal erosion and landslides. We also design specific solutions to provide protection from industrial hazards such as explosions and pollution.

OUR PRODUCTS

Reinforced Earth®
Due to its flexibility and resilience, our historic product can withstand earthquakes and absorb high levels of energy in rockfalls and explosions.

TechSpan®
Our precast concrete arch system protects covered road sections from rockfalls and landslides.
The village of Seyðshofn lies encircled by three mountains at the bottom of the longest fjord in the eastern part of the island. To protect it from avalanches, Reinforced Earth designed a barrier built at an altitude of 2,000 feet. The 65-foot high Reinforced Earth® structure with welded wire mesh facing covers an area of nearly 75,000 sq. feet. It comprises two walls designed which are inclined at angles of 34° and 76° respectively.
Reinforced Earth structures are suitable for a wide variety of uses.

The RETAIN, CROSS, PROTECT business lines address the issues faced by our clients across all sectors.

From roads to railways, oil and gas, mining, airports and coastal protection, our retaining, crossing and protection structures cover a wide variety of sectors. They help to roll out transport systems, improve the living environment and boost economic development while keeping people safe and protecting the environment.

Around the world, the Reinforced Earth Group has helped to build more than 100,000 structures of all sizes, from the very small to the spectacularly large.
Highways & Roads
OPEN ROAD TO STABILITY
Highways and roads commonly use the historic Reinforced Earth® system. The product can be readily adapted to rugged and unstable terrain and has been used to develop a large number of roads. Retaining walls are blended into the mountainous, coastal or urban environment. Reinforced Earth® is also used to build other types of road structures such as bridge abutments, interchanges, access ramps and viaducts.

SWAZILAND
Mbabane junction
The motorway bypass in the capital of Swaziland is 7.5 miles long. For this major infrastructure project, Reinforced Earth designed and supplied 18 retaining walls, including four stepped walls with a height of more than 100 feet, and 16 bridge abutments. The combined surface area is 390,000 sq. ft.

Airports
RUNWAYS TAKE OFF
Reinforced Earth delivers solutions for airport expansion projects. The Reinforced Earth® product requires a limited footprint. It overcomes geotechnical obstacles within the airport perimeter, such as rivers or coastlines. Our structures are able to withstand the large dynamic loads generated by wide-bodied aircraft such as the Airbus A380 and the Boeing 777. Lastly, the facings of these structures have an attractive finish. Access ramps, bridge abutments and retaining walls can therefore be easily blended into the urban landscape.

UNITED STATES
Fort Lauderdale International Airport
For the Florida airport enlargement project, and more particularly for the extension of the south runway, Reinforced Earth designed and supplied 570,000 sq. ft of 62-foot high Reinforced Earth® walls.
Oil & Gas
INDISPENSABLE CONTAINMENT
The remarkable features of Reinforced Earth® overcome physical and thermal constraints to meet the safety requirements of the oil and gas sector. We design protective structures for these high-risk sites, including containment embankments and tank access structures. These structures ensure that hydrocarbon leaks are contained and that any damage is prevented from spreading to other tanks and facilities. The structures withstand earthquakes, fires, explosions and extreme temperature fluctuations.

AUSTRALIA
Port Bonython containment embankment
Reinforced Earth designed and built the containment embankments for the Port Bonython propane and butane tanks near Stony Point, south Australia. The structures are up to 35 feet high and 250 feet in diameter. Their retention capacity is equal to the storage capacity of the tanks (some of which hold more than 3.5 million cu feet).

Mines & Quarries
WALLS ARE NEEDED ON AMBITIOUS PROJECTS
Reinforced Earth® retaining walls and TechSpan® arches meet the requirements of mining structures, which must support heavy loads, withstand vibrations and absorb impact. Our range of facings enable our walls to adapt to the specific geometry of each structure.
Environment

FLEXIBILITY FOR SAFETY

As a result of its high resilience and flexibility, Reinforced Earth® is an ideal solution for the construction of structures designed to provide protection from natural hazards such as avalanches, landslides, rockfalls and tsunamis.

Avalanche berms, slope stabilization structures and breakwaters limit damage to people and the environment.

The welded wire mesh facings used in hard-to-reach areas. TechSpan® arches are used to cover road sections and protect them from rockfalls and landslides.

Dams & Reservoirs

EXEMPLARY IMPOUNDMENT

The Reinforced Earth® product is used to raise dams and increase reservoir capacity. It optimises dam and embankment construction costs by reducing or eliminating slopes downstream from the structures. Reinforced Earth® can also be combined with a waterproofing system to build drinking water reservoirs. Reinforced Earth has also developed systems combining geosynthetic connections and reinforcements, which are particularly well suited to projects in which the backfill contains chemically corrosive materials.

CHILE
Las Tórtolas Dam

Reinforced Earth worked on the construction of a Reinforced Earth® impoundment dam in Las Tórtolas. Four walls were built with two successive heights (46 feet and 72 feet) over a length of 380 feet.

SPAIN
Cut-and-cover tunnel on the A23 highway

Following a landslide in the Pyrenees, emergency work was carried out to secure a section of the A23 highway in the central Province of Huesca. Reinforced Earth designed, fabricated and installed a cut-and-cover structure to protect the highway from rockfall. The 760-foot long structure is made up of precast walls, piers, supports, slabs and beams.

Environment

As a result of its high resilience and flexibility, Reinforced Earth® is an ideal solution for the construction of structures designed to provide protection from natural hazards such as avalanches, landslides, rockfalls and tsunamis.

Reinforced Earth has also developed systems combining geosynthetic connections and reinforcements, which are particularly well suited to projects in which the backfill contains chemically corrosive materials.

CHILE
Las Tórtolas Dam

Reinforced Earth worked on the construction of a Reinforced Earth® impoundment dam in Las Tórtolas. Four walls were built with two successive heights (46 feet and 72 feet) over a length of 380 feet.
Reinforced Earth® demonstrated its full potential in the railway sector for track and track supporting structures. The system has many advantages including high resistance to static loads, vibrations and earthquakes. It uses materials with outstanding durability. It can be easily adapted to geotechnical and architectural specifications.

The CTRL high-speed line connects London with the Channel tunnel terminal in Folkestone. Reinforced Earth designed two cut-and-cover tunnels with lengths of 1,200 feet and 560 feet respectively using the TechSpan® precast concrete arch system.

The CTRL high-speed line connects London with the Channel tunnel terminal in Folkestone. Reinforced Earth designed two cut-and-cover tunnels with lengths of 1,200 feet and 560 feet respectively using the TechSpan® precast concrete arch system.

Reinforced Earth® structures can be built within a short amount of time, require a small base area and have a low environmental footprint. TechSpan® arches, for their part, are used to build railway tunnels under backfill and cut-and-cover structures. We provide solutions for all types of railway lines, including high-speed, regional transport, light rail and tram-train lines.

The people at Reinforced Earth share a passion for engineering, excellence in customer relations and a commitment to safety.

THE REINFORCED EARTH SPIRIT
Our Teams
Guided by a strong team spirit, Reinforced Earth’s employees around the world are committed to innovation and excellence.

A Community of Experts
The people at Reinforced Earth strive to design the best technical solutions for each project, optimize costs and lead times and rigorously comply with all commitments made to clients. Our community derives its strength from the fact that local experience is shared globally. The engineers and technicians in each design office thereby have the benefit of the experience gained by all Reinforced Earth subsidiaries. Our internal network of experts supports their specific needs.

Shared Values
Within their respective geographical scopes, our subsidiaries use local talent. Spanning this geographical and cultural diversity, our employees share the same comprehensive values of safety, innovation and excellence. Safety is a strong part of Reinforced Earth employees’ culture. Innovative capacity underlines the approach taken to each project by our design offices and is the hallmark of their pride in being part of Reinforced Earth. The quest for excellence guides our teams in their decision-making and their actions.

Enhancing Skills
One of the Group’s priorities is training the various categories of employees. We invest in our employees to foster their development and adapt to the changing needs of our clients. Training programs support Reinforced Earth’s excellence goals and reinforce our community of experts.
Reinforced Earth applies a rigorous safety policy across all its subsidiaries. The goal is Zero Accidents.

**TRAINING AND AWARENESS**
To control risks, we painstakingly train all employees in safety. The goal is to develop their skills and raise their awareness to ensure that they are proactively involved in accident prevention and safety.

**MANAGERIAL LEADERSHIP**
Managers at all levels are closely involved in the safety policy. They set an example, ensure effective implementation of safety measures and pay close attention to feedback from the teams in the field.

**HEALTH AND SAFETY IN THE FIELD**
The goal is to control risk and to reduce the number and severity of accidents. Our employees wear safe personal protective equipment. They methodically plan and prepare each job in the field and secure the worksite environment. They are able to identify dangerous situations in order to better address them.

**SAFETY DESIGNED INTO THE STRUCTURE**
From the design stage onwards, our engineers devise safety systems to ensure that our people on the ground can work safely.
ENVIRONMENT PROGRAM
Starting with the initial design studies, Reinforced Earth designs solutions for sustainable structures with low environmental impact.

CONTROLLING ENVIRONMENTAL IMPACT
Our engineers design technical solutions requiring smaller volumes of materials (concrete, steel) than conventional construction methods. These solutions, which range from Reinforced Earth® retaining systems to precast concrete TechSpan® arches, have a much smaller carbon footprint than cast-in-place reinforced concrete structures. In addition, our products are able to use recycled backfill material.

SUSTAINABILITY
The intrinsic qualities of our retaining, crossing and protective structures enable them to withstand extreme stress. Their resilience is particularly remarkable in an earthquake. Lastly, the Reinforced Earth® technique lends itself to a very wide range of aesthetic treatments and such structures blend perfectly and sustainably into the natural or urban environment.

INNOVATION
Our R&D programs enable us to design increasingly efficient solutions that keep pace with environmental goals.

LONG-LASTING INFRASTRUCTURE
In a natural disaster, our prevention and protection solutions limit damage to facilities. We also build structures to protect people and property from accidents at industrial sites.

WHERE TO FIND US
Reinforced Earth has locations in 45 countries to support you around the world.
